

TKN

CONVEYOR CHAIN

CATALOG

 **TKN** TOKUNO

A comprehensive manufacture of conveyor chains providing new value to meet the needs of a new age

Conveying equipment serve as the base for the flow of new products that supply contemporary needs. In this field, Tokuno Manufacturing Co., Ltd. handles the integrated production of conveyor chains, covering all stages from development and design to parts manufacturing and assembly.

For more than sixty years since foundation, we have accumulated experience and technology along with our "Customer First" motto. Through developing new products leveraging our technical capability, and always considering how to provide "new value" to meet the demands of the age and society, we have been delivering appropriate products focusing mainly on the industrial world.

Based on a wealth of experience as well as research and development, we will continue endeavoring to provide products that will leave users satisfied with the TKN brand name.

Guidelines for Selecting Conveyor Chains

Caution

Products listed products are manufactured with proper care. However, incorrect selection, handling, or maintenance can cause breakage of the chain, leading to a severe accident.

For the selection, handling, and maintenance of chains (and sprockets), be sure to consult relevant documents on design and selection, instruction manuals, and other related materials for each product. For inquiries or clarification, please contact us.

1. Selection Method for General Applications

In order to obtain adequate performance of a chain conveyor, it is necessary to select correct conveyor chains according to their intended use. For this purpose, please be sure to fully understand the characteristics of the chain conveyor system and the conditions in which it is used, then select the most appropriate chain for each application. Selecting conveyor chains requires comprehensive knowledge and experience.

■ Selection Procedure

- (1) Type of the conveyor
- (2) Type and nature of the objects to be conveyed
- (3) Quantity of the objects to be conveyed and conveying distance
- (4) Conveying speed
- (5) Ambient conditions
- (6) Operation hours, etc.

The above items except item (4) can be roughly determined when designing the conveyor. Item (4), conveying speed, can also be roughly determined based on the form of conveyance, type of the conveyor, and the quantity of the objects to be conveyed. In the case of selection for special applications, please contact Tokuno Manufacturing Co., Ltd.

1.1. Form of the chain

Comprehensively consider the items in the Selection Procedure, and select appropriate chains.

- Chain pitch
- Roller type
- Attachment type

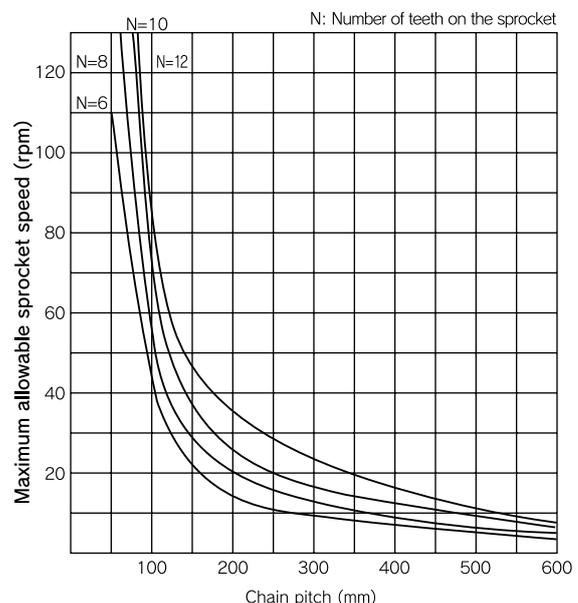

2. Determining the chain pitch

Sizes of the parts attached to the chain, such as slats, trays, buckets, and aprons, are determined based on the

type of the conveyor, shape and nature of the objects to be conveyed, conveyance capacity, conveying speed, etc., and the approximate size of the chain can be determined accordingly. However, the pitch of the conveyor chain is restricted by the rotation speed and the number of teeth on the sprocket as shown in the graph below; therefore, the sprocket speed (rpm), as obtained from the equation below, must be less than the allowable speed.

$$\text{Sprocket speed (rpm)} = \frac{1000 \times \text{Conveying speed (m/min)}}{\text{Number of teeth} \times \text{Pitch (mm)}}$$

In general, selecting a chain so that the pitch is as small as possible within the scope of requirements will help to suppress shock during conveyance and lengthen its life span.

Relationship between the chain pitch and the maximum allowable sprocket speed

Guidelines for Selecting Conveyor Chains

3. Maximum chain tension and transmission power

The maximum tension applied to the chain during operation and the required transmission power can be calculated using the formulas given in Table 4.

- T : Maximum chain tension (load) kN {kgf}
 Q : Maximum quantity of objects conveyed t/h {tf/h}
 S : Conveying speed (chain speed) m/min
 V : Vertical center distance between sprockets m
 H : Horizontal center distance between sprockets m
 C : Center distance between sprockets m
 M : Mass {weight} of moving parts kg/m {kgf/m}
 (Mass {weight} of the chains, buckets, aprons, etc.)
 f₁ : Coefficient of friction between chain and guide rail
 Tables 1 and 2
 f₂ : Coefficient of friction between object conveyed and bottom/side plates Table 3
 η : Mechanical efficiency of power transmission at the actuator
 kw : Required transmission power kw
 W : Total mass {weight} of objects conveyed on the conveyor kg {kgf}
 g : Gravitational acceleration 9.80665m/S²

Note: With reference to the above unit symbols, the values for mass (kg) and weight (kgf) are to be the same.

Table 1: Coefficient of rolling friction between chain and guide rail (at room temperature) f₁

| Roller diameter D (mm) | With lubrication | Without lubrication |
|------------------------|------------------|---------------------|
| D < 50 | 0.15 | 0.20 |
| 50 ≤ D < 65 | 0.14 | 0.19 |
| 65 ≤ D < 75 | 0.13 | 0.18 |
| 75 ≤ D < 100 | 0.12 | 0.17 |
| 100 ≤ D | 0.11 | 0.16 |

Table 2: Coefficient of sliding friction between chain and guide rail f₁

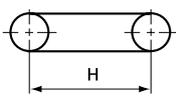

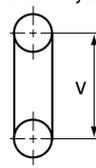

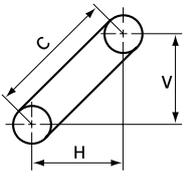

| Temperature of object conveyed (°C) | With lubrication | Without lubrication |
|-------------------------------------|------------------|---------------------|
| Room temperature~400 | 0.20 | 0.30 |
| 400~600 | 0.30 | 0.35 |
| 600~800 | 0.35 | 0.40 |
| 800~1,000 | — | 0.45 |

Table 3: Coefficient of friction f₂

| Object conveyed | f ₂ |
|-----------------|----------------|
| Coal | 0.30~0.70 |
| Coke | 0.35~0.70 |
| Ash | 0.45~0.65 |
| Sand | 0.55~0.90 |
| Grit | 0.55~0.70 |
| Ore | 0.45~0.70 |
| Cement | 0.60~0.75 |
| Grain | 0.35~0.45 |
| Limestone | 0.35~0.55 |

Note: The f₂ values vary depending on the grain size, moisture condition, etc.

Table 4: Formulas to calculate tension

| Configuration of conveyance | Method of conveyance | Form of object conveyed | SI units | Gravitational units |
|--|---|-------------------------|--|--|
| Horizontal conveyance  | Loaded conveyance (Slat conveyors, apron conveyors, etc.) | Mass-produced items | $T = (W + 2.1MH) f_1 \times \frac{g}{1000}$ $kw = \frac{T \cdot S}{54.5\eta}$ | $T = (W + 2.1MH) f_1$ $kw = \frac{TS}{5565\eta}$ |
| | | Bulk solids | $T = (16.7 \frac{Q}{S} + 2.1M) H f_1 \times \frac{g}{1000}$ $kw = \frac{T \cdot S}{54.5\eta}$ | $T = (16.7 \frac{Q}{S} + 2.1M) H f_1$ $kw = \frac{TS}{5565\eta}$ |
| | Scraped conveyance (Flow conveyors, scraper conveyors, etc.) | Bulk solids | $T = (16.7 \frac{Q}{S} f_2 + 2.1M f_1) H \times \frac{g}{1000}$ $kw = \frac{T \cdot S}{54.5\eta}$ | $T = (16.7 \frac{Q}{S} f_2 + 2.1M f_1) H$ $kw = \frac{TS}{5565\eta}$ |
| Vertical conveyance  | Loaded conveyance (Bucket elevators, tray elevators, etc.) | Mass-produced items | $T = (W + MV) \times \frac{g}{1000}$ $kw = \frac{T \cdot S}{54.5\eta} \times \frac{g}{1000}$ | $T = W + MV$ $kw = \frac{W \cdot S}{5565\eta}$ |
| | | Bulk solids | $T = \{ (16.7 \frac{Q}{S} + M) (v + 2) \} \times \frac{g}{1000}$ $kw = \frac{Q(V+2)}{333\eta}$ | $T = (16.7 \frac{Q}{S} + M) (v + 2)$ $kw = \frac{Q(V+2)}{333\eta}$ |
| Inclined conveyance  | Loaded conveyance (Slat conveyors, apron conveyors, etc.) | Mass-produced items | $T = \{ (W + MC) \frac{Hf_1 + v}{C} + 1.1M (Hf_1 - v) \} \times \frac{g}{1000}$ $kw = \frac{S}{54.5\eta} \{ T - M(v - Hf_1) \times \frac{g}{1000} \}$ | $T = (W + MC) \frac{Hf_1 + v}{C} + 1.1M (Hf_1 - v)$ $kw = \frac{S}{5565\eta} \{ T - M(v - Hf_1) \}$ |
| | | Bulk solids | $T = \{ (16.7 \frac{Q}{S} + M) (Hf_1 + v) + 1.1M (Hf_1 - v) \} \times \frac{g}{1000}$ $kw = \frac{S}{54.5\eta} \{ T - M(v - Hf_1) \times \frac{g}{1000} \}$ | $T = (16.7 \frac{Q}{S} + M) (Hf_1 + v) + 1.1M (Hf_1 - v)$ $kw = \frac{S}{5565\eta} \{ T - M(v - Hf_1) \}$ |
| | Scraped conveyance (Flow conveyors, scraper conveyors, etc.) | Bulk solids | $T = \{ (16.7 \frac{Q}{S} (Hf_2 + v) + M (Hf_1 + v) + 1.1M (Hf_1 - v) \} \times \frac{g}{1000}$ $kw = \frac{S}{54.5\eta} \{ T - M(v - Hf_1) \times \frac{g}{1000} \}$ | $T = (16.7 \frac{Q}{S} (Hf_2 + v) M (Hf_1 + v) + 1.1M (Hf_1 - v)$ $kw = \frac{S}{5565\eta} \{ T - M(v - Hf_1) \}$ |

Note: In the above formulas, if Hf₁ - V < 0, then let Hf₁ - V = 0. Also, if V - Hf₁ < 0, then let V - Hf₁ = 0.

Guidelines for Selecting Conveyor Chains

4. Load correction factors

The value of the maximum chain tension obtained from the tension calculation formula in Table 4 needs correction depending on various factors such as the ambient conditions in which the chain is used and the chain speed. Obtain the service factor from Table 5 and the safety factor for chain speed from Table 6 to correct the value.

Table 5: Service factor SF

| Service condition | Operation hours per day | |
|-------------------|-------------------------|---------------|
| | Within 10 hours | Over 10 hours |
| Good | 1.0 | 1.2 |
| Rather bad | 1.2 | 1.4 |
| Very bad | 1.5 or more | 1.8 or more |

Table 6: Safety factor for chain speed SV

| Chain speed (m/min) | Safety factor SV |
|---------------------|------------------|
| 20 or less | 7 |
| 20~30 | 7~9 |
| 30~40 | 8~10 |
| 40~50 | 9~13 |
| 50~60 | 10~15 |
| 60 or more | 12~20 |

5. Determining the chain size

Select the appropriate chain size from the catalog based having determined the maximum chain tension (load) and the load correction factors that will satisfy the formula given below.

$$\boxed{\text{Average tensile strength of chain}} \geq \boxed{\text{Calculated value of chain tension}} \times \boxed{\text{Service factor SF}} \times \boxed{\text{Safety factor for chain speed SV}}$$

If any of the following working conditions apply, please contact Tokuno Manufacturing Co., Ltd.

- Short distance conveyance of objects with a heavy load.
- Abrasive, adhesive, or corrosive objects are to be conveyed and may spill down on the chain.
- High-temperature, high-humidity atmosphere.

6. Determining the attachment

Select the most suitable attachment for the shapes and sizes of the objects to be attached, according to the type of conveyor.

7. Roller types

Tokuno Manufacturing Co., Ltd. offers three types of rollers (i.e. S(M), R, and F) for both TM- and TE-type conveyor chains.

Select the most appropriate roller type for the

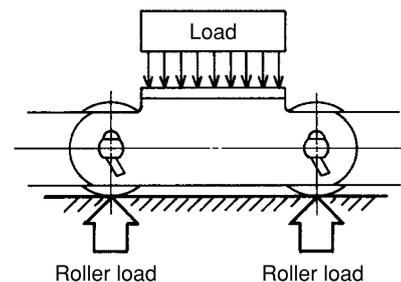

working conditions of the conveyor. Use the R or F rollers except in the case of vertical conveyance. The S(M) rollers, wherever possible, should not be used except for the following cases:

- Light objects are to be conveyed.
- Conveying distance is short.
- Long life span is not required.
- Mass is supported by plates.

(For reference)

Allowable roller load (R-type and F-type rollers)

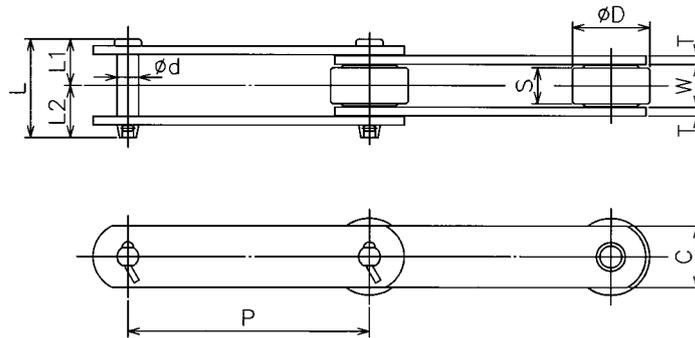

Since the allowable roller load differs depending on the objects conveyed and the conveyance conditions, there is no unified form of representation. For reference purposes, the table below shows the allowable roller loads in circumstances where lubrication is possible. The material for the chain rails is required to have a tensile strength of 400 N/mm² {41 kgf/mm²} or greater.

Allowable load of R-type and F-type rollers Units: kN(kgf)/roller

| Chain | Regular Series | | High-strength Series | |
|---------------|----------------|------|----------------------|------|
| | kN | kgf | kN | kgf |

Flow Conveyor Chains

The flow conveyor, which conveys powder/granular materials in closed containers, is an optimal conveyor in terms of the prevention of dust pollution.

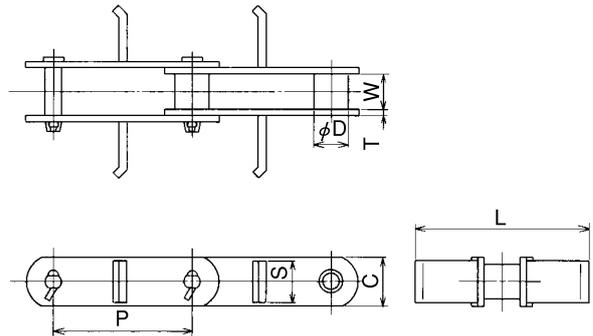

The attachments for these chains have been designed specifically for flow conveyors. Select the attachment type according to the object to be conveyed.

The materials of the chains themselves correspond to those for standard conveyor chains (Regular Series or High-strength Series). Wear-resistant series are also available for design and manufacture.

Notes: Basic specifications for the chains are the same as those for the TM/TE standard conveyor chains.
Chain codes for the High-strength Series are to begin with TMH or TEH, instead of TM or TE respectively.

Deep Link Conveyor Chains

Based on the TM/TE type standard conveyor chains, these chains incorporate wide plates and R-type rollers, and convey objects directly placed on the plates.

Application Examples

1. Sheet and section steel conveyor lines at ironworks
2. Automotive assembly lines
3. Pallet/container conveyor lines

■ Dimensions

| Chain code | Pitch P | Roller | | Width between inner link plates W | Chain height H | Plate | | | Pin | | Approx. mass (kg/m) | Average tensile strength | | | |

Notes: Basic specifications for the chains are the same as those for the standard conveyor chains.
Chain codes for the High-strength Series are to begin with TMSHD, TMHD, or TEHD, instead of TMSD, TMD, or TED respectively.

Conveyor Chains with Outboard Rollers

Based on the TM/TE type standard conveyor chains with S-type rollers, these chains incorporate side rollers fitted onto extended pins on both sides. While the S-type rollers at the center engage with the sprockets, the side rollers serve to guide the chain movement. Using various attachments, these chains have a wide range of applications.

Intended Use

1. In cases where special attachments on the plates cause instability.
2. In cases where it is difficult to support the load with the S-type rollers at the center.
3. In cases where it is difficult to guide the chain on the return side
4. In cases where R-roller type outboard rollers (SRR) are to have an accumulating function.

Dimensions

| Chain code | Pitch | Roller diameter D | Width between inner link plates W | Plate | | Side roller SRF | | | | Side roller SRR | | | Rail gauge (SRF) | Approx. mass of main part (kg/m) | Additional weight per pair of SR (kg) | |

Notes: 1. Basic specifications for the chains, including the mean tensile strength, are the same as those for the TM/TE standard conveyor chains.
2. When placing an order, please specify the necessity, if any, of quenching the side rollers and their placing intervals.

Conveyor Chains with Top Rollers

Based on the TM/TE type standard conveyor chains with R-type rollers, these chains incorporate a top roller on the upper part in the middle of each chain pitch, and directly support the objects conveyed.

Intended Use

1. In cases where the chains are being operated continuously, conveyed objects can be accumulated or temporarily stopped with a stopper above the conveyor.
2. In cases where conveying and stopping temporary are to be performed repeatedly on the same chain line.

TZ Type Trolley Conveyor Chains

Chains of this type can be curved both horizontally and vertically; in other words, they can be curved three dimensionally. In general, these chains run inside C-shaped light-gauge steel rails, and are used to suspend relatively light loads in conveyor lines involving vertical and horizontal movements.

| TYPE | P | Average tensile strength | Vertical R (min.) | Horizontal R (min.) | Maximum 1-point suspending load | Allowable tension | Approx. mass |
|----------|----|--------------------------|-------------------|---------------------|---------------------------------|-------------------|--------------|
| TZI type | 75 | 49kN {5,000kgf} | 600mm | 600mm | 25kgf | 4.9kN {500kgf} | 4.6kg/m |

Designated maximum operating temperature of the TZ type trolley conveyor chains is 180°C. Additionally, high-temperature type chains are also available (210°C).

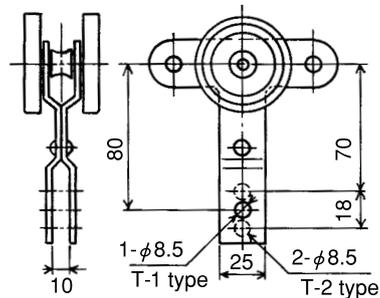

| Chain | Item | Operating temperature (max.) | Rollers | | Remarks |
|---------------------|------|------------------------------|-------------------|----------------------|-----------------------------------|
| | | | Side rollers | Intermediate rollers | |
| Standard type | | 180°C | Retainer bearings | Press bearings | — |
| Heat-resistant type | | 210°C | All-ball bearings | All-ball bearings | Heat-resistant oil to be supplied |

Hangers

T-shaped hanger

This hanger is integrated with chain plates. Available in two types according to the number of holes: the T-1 type with one hole and the T-2 type with two holes. Please specify the intervals as the number of links between hangers.

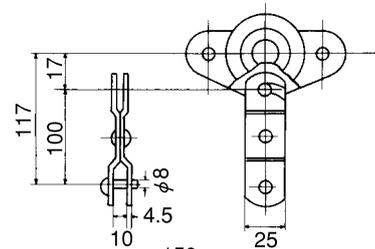

Hanging load: 25kgf (including the hanger weight)

A-shaped hanger

This hanger can easily be removed and attached to desired locations.

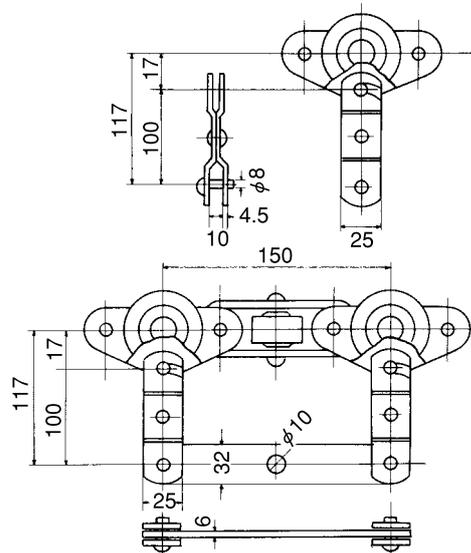

Hanging load: 25kgf (including the hanger weight)

C-shaped hanger

This hanger is composed of two A-shaped hangers attached to the chain and a horizontal plate linking them in between. When an object is hung from the center of the plate, the load is equally distributed to both hangers.

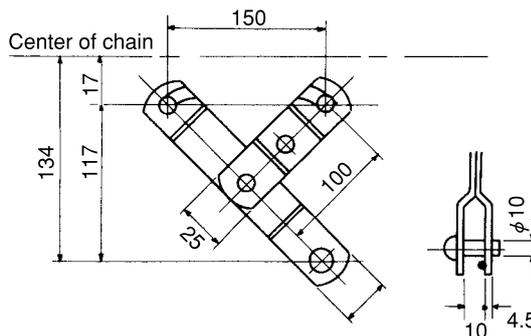

Hanging load: 50kgf (including the hanger weight)

Y-shaped hanger

This is a combination of an A-shaped hanger and another hanger. While the hanger can be removed as shown in the figure to the right, the hanger itself functions in the same way as a fixed type.

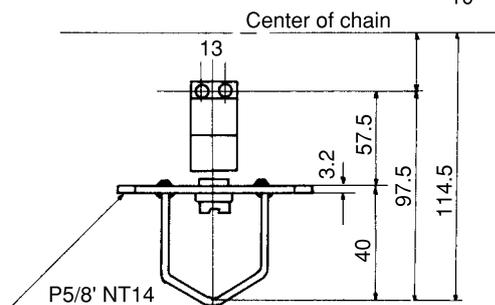

Hanging load: 50kgf (including the hanger weight)

D-shaped hanger

With this hanger, only the hanging metal fitting of the chain is fixed. The part below the rotation wheel can be replaced. Used for a wide range of applications including painting and drying.

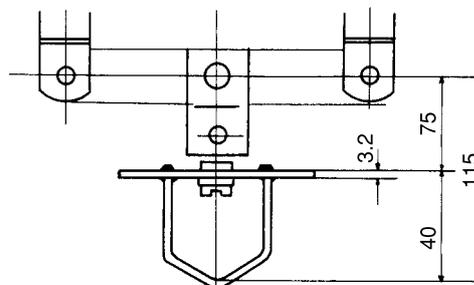

Hanging load: 25kgf (including the hanger weight)

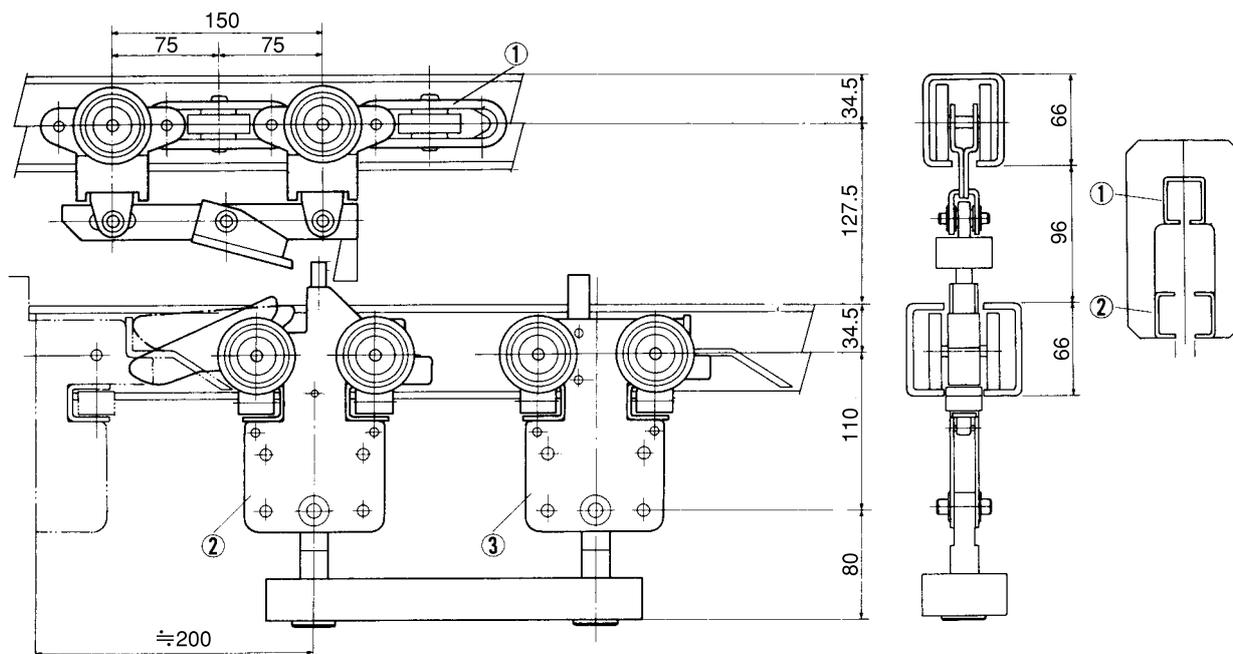

C- + D-shaped hanger

This hanger is a combination of a C-shaped hanger and a D-shaped hanger.

Hanging load: 50kgf (including the hanger weight)

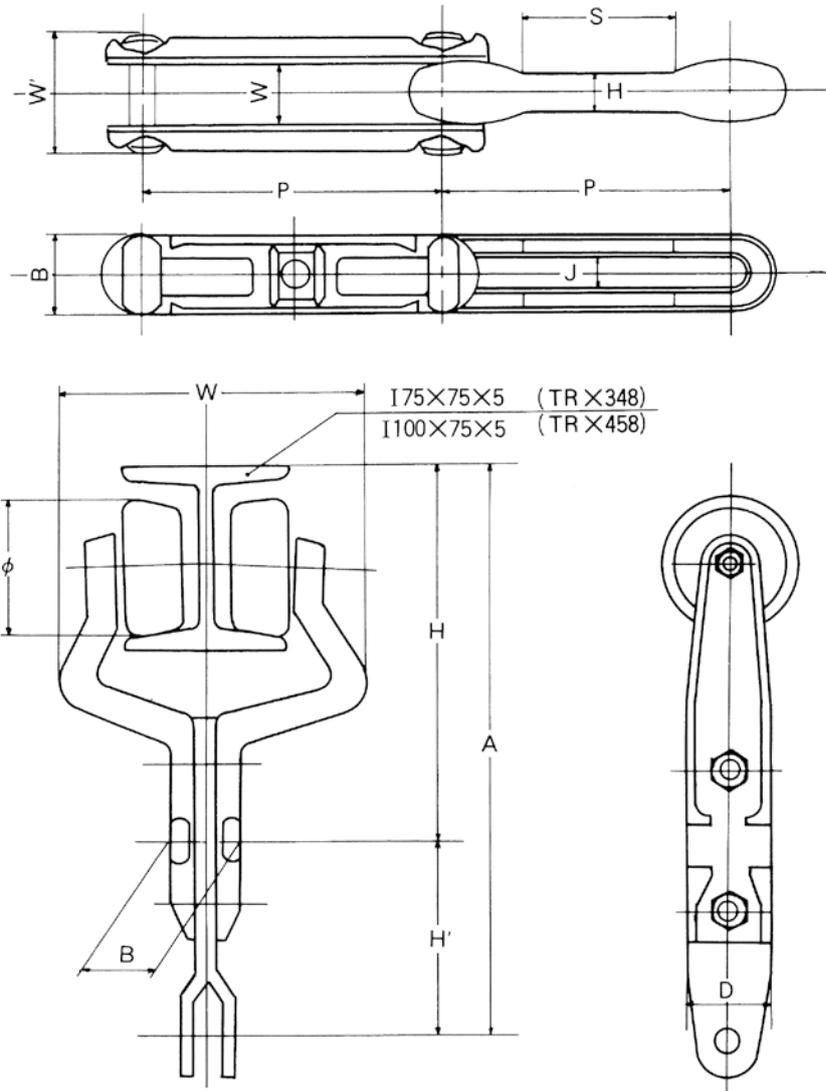

An application example of a TZ type trolley conveyor chain PF-L Conveyor System

The PF-L Conveyor System was developed specifically for the purpose of conveying light-weight parts. In addition to simply conveying objects, this new conveyor system can also incorporate such functions as diverging/converging and drop-lift storage, allowing effective utilization of space and flexible design of production lines for different purposes, such as process automation and unattended operations.

TRX Rivetless Chain • Trolley Hanger

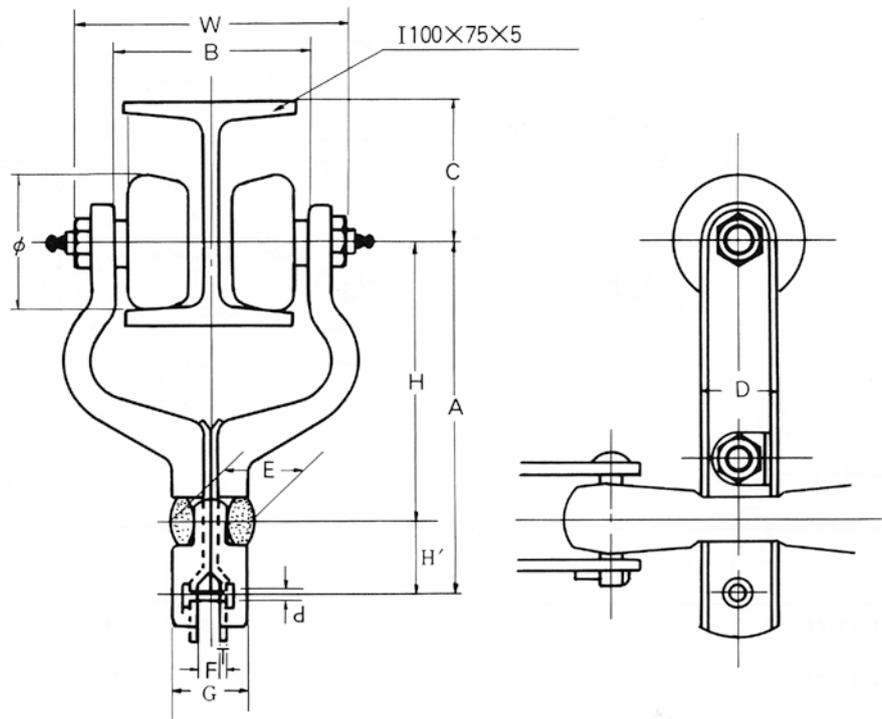

■ Forged Rivetless Chain (inch Type)

| Chain code | P | W | W' | B | J | S | H | Approx. mass (kg/m) | Average tensile strength kN {kgf} |
|------------|-------|----|------|----|----|----|----|---------------------|-----------------------------------|
| TRX 348 | 76.2 | 21 | 44.1 | 28 | 14 | 46 | 13 | 2.75 | 102.9 {10,500} |
| TRX 458 | 102.4 | 27 | 55.5 | 35 | 17 | 56 | 17 | 4.35 | 205.8 {21,000} |

■ Forged Trolley Hanger (inch Type)

| Chain code | A | H | H' | W | B | φ | D | Approx. mass (kg/set) | Suspending load (kgf) |
|------------|-----|-----|----|-----|----|----|----|-----------------------|-----------------------|
| TRX 348 | 210 | 140 | 70 | 122 | 28 | 54 | 40 | 1.5 | 125 |
| TRX 458 | 256 | 183 | 70 | 137 | 35 | 80 | 54 | 2.8 | 250 |

TRX Rivetless Chain • Trolley Hanger

■ Drawed Trolley Hanger (inch Type)

| Chain code | A | H | H' | C | W | B | ϕ | E | F | d | D | G | T | Approx. mass (kg) | Suspending load (kgf) |
|------------|-----|-----|----|----|-----|----|--------|------|----|----|----|----|-----|-------------------|-----------------------|
| TRL 348 | 146 | 111 | 35 | 63 | 116 | 76 | 58 | 28.6 | 10 | 12 | 40 | 28 | 3.2 | 1.7 | 100 |
| TRL 458 | 184 | 144 | 40 | 53 | 114 | 76 | 80 | 35 | 12 | 12 | 54 | 32 | 4.5 | 2.8 | 200 |

■ Horizontal Corner

There are two types of Horizontal Corner; Turn Roller Type and Traction Wheel Type.

Standards for Turn Roller Type are

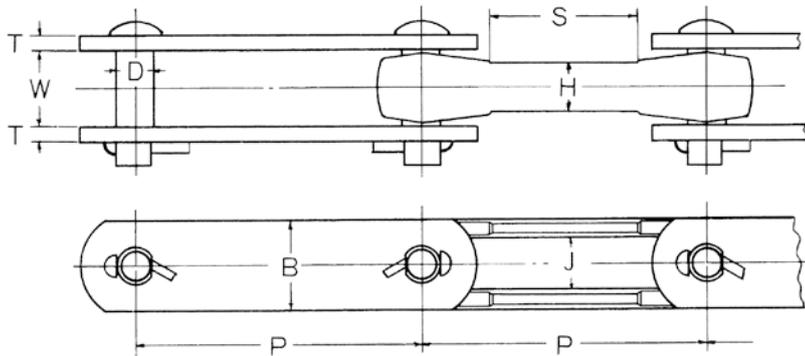

- 90° — R600, R800, R1000, R1500
- 180° — R600, R800, R1000, R1500

Standards for Traction Wheel Type are

- 90° — R300~R550
- 180° — R300~R550

Units with different R and angles can be designed and manufactured by requests.

Standard Trolley Conveyor Chain

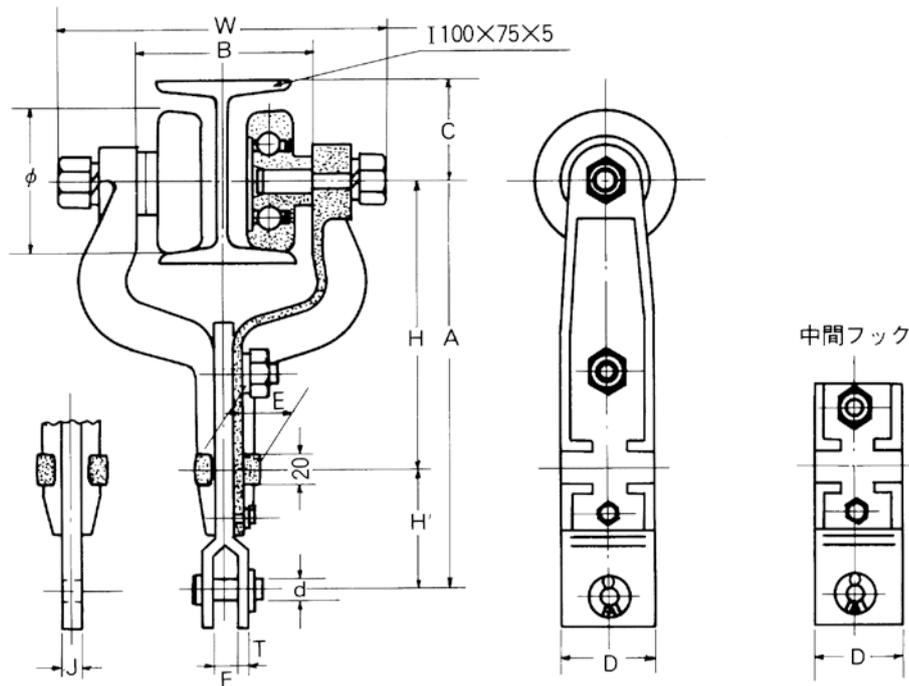

■ Trolley Chains (millimeter Type)

| Chain code | P | T | W | D | B | J | S | H | Approx. mass (kg/m) | Average tensile strength kN {kgf} |
|------------|-----|---|----|----|----|----|----|----|---------------------|-----------------------------------|
| TRL 16100 | 100 | | | | | | | | 5.62 | |
| TRL 16125 | 125 | 8 | 31 | 16 | 35 | 18 | 50 | 20 | 5.12 | 176.4 |
| TRL 16150 | 150 | | | | | | | | 4.68 | {18,000} |
| TRL 20125 | 125 | 9 | 32 | 18 | 38 | 20 | 50 | 20 | 6.57 | 235.2 |
| TRL 20150 | 150 | | | | | | | | 6.07 | {24,000} |

■ Trolley Chains (inch Type)

| Chain code | P | T | W | D | B | J | S | H | Approx. mass (kg/m) | Average tensile strength kN {kgf} |
|------------|-------|-----|----|------|------|----|----|------|---------------------|-----------------------------------|
| TRL 348 | 77 | 6.3 | 21 | 12.7 | 28.6 | 14 | 42 | 12.7 | 3.3 | 79.9 |
| TRL 458 | 102.4 | 8 | 27 | 15.8 | 35 | 17 | 56 | 17 | 4.1 | 137.2 |

Trolley Hanger

■Forged Trolley Hanger for TRL

Forged Trolley Arms withstand heavy loads and impacts sufficiently.
Also, the arms can be used for a long term.
They are made of SUJ-2 and sealed with heat-resistant grease.

Trolley Hangers can be arranged 2-point suspending, 4-point suspending, and so on.
Hanging parts can be designed and manufactured for its use.
(When suspending loads are more than 300kgf should be used 2-point suspending.)

■Trolley Hanger (millimeter Type)

| Chain code | A | H | H' | C | W | B | φ | E | F | d | D | T | Approx. mass (kg) | Suspending load (kgf) |
|------------|-----|-----|----|----|-----|----|----|----|----|----|----|-----|-------------------|-----------------------|
| TRL I | 229 | 159 | 70 | 53 | 180 | 94 | 80 | 35 | 12 | 12 | 50 | 4.5 | 4.2 | 300 |
| TRL II | 229 | 159 | 70 | 53 | 183 | 97 | 80 | 38 | 12 | 12 | 50 | 6.0 | 4.3 | 300 |

■Trolley Hanger (inch Type)

| Chain code | A | H | H' | C | W | B | φ | E | F | d | D | T | Approx. mass (kg) | Suspending load (kgf) |
|------------|-----|-----|----|----|-----|----|----|------|----|----|----|-----|-------------------|-----------------------|
| TRL 348 | 181 | 111 | 70 | 63 | 177 | 91 | 58 | 28.6 | 12 | 12 | 40 | 3.2 | 3 | 125 |
| TRL 458 | 214 | 144 | 70 | 53 | 180 | 94 | 80 | 35 | 12 | 12 | 54 | 4.5 | 4.7 | 250 |

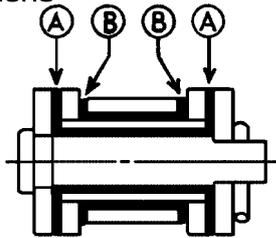

Lubrication of Conveyor Chains (Supplying Oil)

Periodical lubrication is essential for the chain to be used for an extended period. Lubrication decreases the wear of chain parts, as well as reducing required power.

◆ A general rule for lubrication

Supply oil approximately once a week by hand oiling or drip-feed lubrication; however, more frequent lubrication is required for a certain period after initial operation (running-in period).

◆ Lubrication locations

- Ⓐ Between pin and bushing
- Ⓑ Between bushing and roller

◆ Avoid lubrication in the following cases:

1. Where the chain is buried in the object conveyed
2. Where it is deemed that, when powder/granular materials are being conveyed, lubrication will cause adverse effects due to the adhesion of such materials to the chain
3. Where the chain temperature becomes high

◆ Recommended lubricating oils (for reference)

| Viscosity (SAE viscosity classification) Manufacturer | ISO VG 100 (SAE 30) | ISO VG 150 (SAE 40) | ISO VG 220 (SAE 50) |
|--|-------------------------|---------------------------|-------------------------|
| Idemitsu Kosan | Daphne Mechanic Oil 100 | Daphne Mechanic Oil 150 | Daphne Mechanic Oil 220 |
| | Tellus Oil C 100 | Tellus Oil C 150 | Tellus Oil C 220 |
| JXTG Nippon Oil & Energy Corporation | FBK Oil RO 100 | FBK Oil RO 150 | FBK Oil RO 220 |
| | Diamond Lube RO 100 | Diamond Lube RO 150 | Diamond Lube RO 220 |
| Exxon Mobil | Mobil DTE Oil Heavy | Mobil DTE Oil Extra Heavy | Mobil DTE Oil BB |
| | Teresso100 | Teresso150 | — |

Manufacturer names are listed in random order.

For Safe Use

Precautions for handling the chain

To avoid danger, follow the instructions below.

- ◆ DO NOT make any modifications to the chain.
 - Do not anneal any parts of the chain.
 - Do not wash the chain with acidic or alkaline solutions. Doing so may cause cracks.
 - Do not electroplate the chain or any part of it. Doing so may cause cracks due to hydrogen embrittlement.
 - Do not weld anything to the chain. Doing so may impair the strength of the chain or cause cracks under the influence of heat.
 - If the chain is thermally cut by a torch or other similar equipment, remove the links adjacent to and near the cut section completely. Do not reuse the removed links.
- ◆ If the chain is worn or damaged even partially, replace the entire chain with a new one, rather than replacing only the worn or damaged section.
- ◆ When using a chain with suspending equipment, set up a safety fence or other barrier, and do not allow persons to come under the suspended objects.
- ◆ Be sure to provide a guard, such as a safety cover, for the chains and sprockets.
- ◆ Abide by Section 1 General Standards, Chapter I, Part II of the Ordinance on Industrial Safety and Health.
- ◆ When handling the chain (installing, removing, servicing, oiling, etc.):
 - ◆ Follow the instructions in the manual or the catalog.
 - Turn off power before working on the chain, and take measures to prevent the device from being switched on unexpectedly.
 - When linking or separating a chain, support it in a fixed position so that the chain and parts do not move freely.
 - When separating or linking a chain, use pressing apparatus and specialized tools, and follow the appropriate procedure.
 - Removal and insertion of pins and rivets is to be conducted in the correct direction.
 - Wear clothes that are appropriate for the work, and appropriate protective gear (safety goggles, gloves, safety shoes, etc.).
 - Replacement of chains is to be performed by authorized personnel.

To prevent accidents, observe the instructions below.

- ◆ Make sure you understand the structure and specifications of the chain before handling it.
- ◆ Before installing the chain, check it for any damage which may have been caused during transportation.
- ◆ Be sure to check and maintain the chains and sprockets periodically.
- ◆ Strength of chains differs depending on the manufacturer. Be sure to use Tokuno Manufacturing Co., Ltd. products if they have been selected based on our catalog or drawings.
- ◆ The mean tensile strength is the mean value of load at which the chain breaks, and is not the minimum tensile strength. Furthermore, this does not mean the actual working load.
- ◆ If there is a possibility that disconnecting a chain could cause accidents resulting in injury or death, or serious damage to equipment, do not disconnect the chain, or alternatively, provide safety equipment to prevent serious accidents even if the chain is disconnected.
